If you are interested in getting corresponding physical clones,
these are publicly available from ZmDB and may be found by BLAST
searching at MSL, maizemap.org; ZmDB, www.zmdb.isstate.edu, TIGR,
www.tigr.org; or NCBI, www.ncbi.nlm.nih.gov. When the source of the
maize cDNA sequences is either Virginia Walbot, Stanford or Pat
schable, lowa State, then clones may be requested from ZmDB:
www.zmdb.isstate.edu.

library, normalized, full-length"
/note="Vector: pCMVSport6.1; Site 1: EcoRI; Site 2: NotI;
supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-stressed leaves (38 C, 3 hr and 6 hr),
cold-stressed leaves (5C 3 hr, 6hr), and pathogen
challenged leaves (Fseudomonas syringae pv tomato 12 hr;
Xanthomonas campestris pv campestris 12 hr, 18hr;
Pseudomonas syringae pv phaseolicola 18hr, and Xanthomonas
campestris pv vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar
amounts."

/clore_lib="Nicotiana benthamiana mixed tissue cDNA library, normalized, full-length."
//clore_lib="Nicotiana benthamiana library, normalized, full-length."
//cote="Vector: pCNVSport6.1; Site_1: EcoRI; Site_2: NotI; supplier: RNA was isolated from Nicotiana benthamiana tissues that include callus, roots from liquid culture grown plants, heat-stressed leaves (38 C, 3 hr and 6 hr), cold-stressed leaves (5 C 3 hr, 6hr), and pathogen cold-stressed leaves (5 C 3 hr, 6hr), and pathogen campestris pv campestris 12 hr, 18hr; Xanthomonas campestris pv campestris 12 hr, 18hr; Pseudomonas sytingae pv phaseolicola labr, and Xanthomonas campestris pv vesicatoria 18hr). RNA was isolated from these tissues and pooled in approximately equal molar amounts."

supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-estressed leaves (S C 3 hr, 6hr), and pathogen
challenged leaves (S C 3 hr, 6hr), and pathogen
challenged leaves (Pseudomonas syringae pv tomato 12 hr;
Xanthomonas campestris pv campestris 12 hr, 18hr;
Pseudomonas syringae pv phaseolicola 18hr, and Xanthomonas
campestris pv vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar
                                                                                 EST745257 Nicotiana benthamiana mixed tissue cDNA library,
normalized, full-length Nicotiana benthamiana cDNA clone NBWAD20 3'
end, mRNA sequence.

supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-stressed leaves (38 C, 3 hr and 6 hr),
cold-stressed leaves (5 C 3 hr; 6hr), and pathogen
challenged leaves (5 Eseudomonas syringae pv tomato 12 hr;
Xanthomonas campestris pv campestris 12 hr, 18hr;
Pseudomonas syringae pv phaseolicola 18hr, and Xanthomonas
campestris pv vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar
amounts."

OLISO WHY TO JOYE SIHL

```
The present invention relates to an isolated protein having L-galactose dehydrogenase (L-galDH) biological activity. L-galDH uncleic acid is useful for generating transgenic organisms and modified pants with enhanced ability to synthesise ascorbic acid. L-galDH facilitate the production of a plant that has been genetically modified to express a mutated L-galDH protein which is resistant to herbicides that act against the naturally occurring L-galDH and to identify and/or design compounds that are inhibitors of L-galDH and to identify and/or design compounds the enzyme. The present sequence is Arabidopsis thalls plants that express the enzyme. The present sequence is Arabidopsis thallana L-galactose dehydrogenase (L-galDH) protein. The L-galDH gene is located on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chromosome 4

ALIGNMENTS

L-galactose dehydrogenase; L-galDH; transgenic organism; ascorbic acid; herbicide; chromosome 4. Novel L-galactose dehydrogenase protein and nucleic acid sequence encoding the protein for producing genetically modified plants and microorganisms with enhanced ability to synthesize ascorbic acid. Arabidopsis thaliana L-galactose dehydrogenase (L-galDH) protein. Ź Claim 1; Page 57-58; 58pp; English AAE11998 standard; protein; 319 29-MAR-2001; 2001WO-GB001412. 29-MAR-2000; 2000GB-00007651. (first entry) Smirnoff N, Wheeler G; Arabidopsis thaliana WPI; 2001-616482/71. N-PSDB; AAD19526. (ASCO-) ASCORBEX LTD WO200172974-A2.

```
precursor into ascorbic acid, culturing the recombinant yeast in a medium comprising an ascorbic acid precursor, thus forming ascorbic acid, and isolating the ascorbic acid. Also include are stabilishing ascorbic acid or its salt in a medium, by culturing a yeast in a medium comprising carcible acid or its salt and a recombinant yeast functionally carcible acid or its salt and a recombinant yeast functionally cartivity selected from L-galactose dehydrogenase (LGDH), L-galactono-1, 4-lactone dehydrogenase (AGD), D-arabinose dehydrogenase (AGD), D-arabinose dehydrogenase (AGD), carabinose dehydrogenase (AGD), con a combinant yeast is capable of converting to ascorbic acid at least about 25% ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor. The ascorbic acid produced (Vitamin C) is a powerful antioxidant, a deficiency of which causes scurvy in humans. The present sequence

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 Novel L-fucose dehydrogenase gene - a new recombinant DNA and the prepn. of L-FDH using a L-FDH vector.
 The L-FDH gene is new and can be used for the recombinant prodn. of the enzyme. (Updated on 16-OCT-2003 to standardise OS field)

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
 234 RPAANATYNYAPAPQELLDRANLLADVCESHGTTLFAAALHFPYQHPAVTSVVLGMRTPA 293
 The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is postitioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance,

 Genomic DNA from Arthrobacter oxidans F1 was subjected to restriction enzyme analysis and the N-terminal amino acid sequence of L-fucose dehydrogenase determined. A degenerate probe was synthesised based on this amino acid sequence. The probe was used to screen an Arthrobacter CDNA library to isolate a L-fucose dehydro- genase clone. The isolation of such a clone provides a convenient method for prodn. of L-fucose dehydrogenase without the need for induction by L-fucose. The probe may be used to evaluate the extent of expression of L-fucose dehydrogenase. The DNA sequence is widely used to assay L-fucose levels. The protein sequence of L-fucose dehydrogenase may be used to produce antibodies. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid of promoter operably linked to the antisense nucleic acid, (2) an bost cell containing the vector; (3) an isolated oplypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the proliferation or that an ectivity against a biological pathway the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a compound that inhibits proliferation of an agene on which a proliferation required for cellular proliferation of the biological pathway in which a proliferation-required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains or strains as present in a culture or collection of strains; or (13) identifying the arrains for maniferation to isolate candidate molecules for rational correlification in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. acruginosa. The present sequence is encoded by one of the target prokaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at Everypeanse of the sequences.

 The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as templates for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67926-CF ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence. The sequence of the printed sequence. The sequence of the printed sequence.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to generating ascorbic acid or its salt, involves obtaining a recombinant yeast capable of converting an ascorbic acid coloration of precursor into ascorbic acid, culturing the recombinant yeast in a medium comprising an ascorbic acid precursor, thus forming ascorbic acid, and cisolating the ascorbic acid. Also include are stabilising ascorbic acid or its salt in a medium, by culturing a yeast in a medium comprising or ascorbic acid or its salt and a recombinant yeast functionally cransformed with a coding region encoding a protein having an enzyme cultivity selected from L-galactose dehydrogenase (LGDH), L-galactono-1, 4-lactone oxidase (AGD), D-arabinose dehydrogenase (RGD), D-arabinose dehydrogenase (RGD) and aldonolactonase (AL) activity, where the recombinant yeast is capable of converting to ascorbic acid at least about 25% ascorbic acid precursor or is capable of producing at least about 25% ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor. The ascorbic acid precursor. The ascorbic acid precursor. The ascorbic acid precursor. The ascorbic acid precursor.

 The present invention relates to an isolated protein having L-galactose dehydrogenase (L-galbH) biological activity. L-galbH incleic acid is useful for generating transgenic organisms and modified pants with enhanced ability to synthesise ascorbic acid. L-galbH facilitate the production of a plant that has been genetically modified to express a mutated L-galbH protein which is resistant to herbicides that act against the naturally occurring L-galbH and to identify and/or design compounds that are inhibitors of L-galbH and to identify and/or design compounds therbicide which acts on L-galbH and damages or kills plants that express the enzyme. The present sequence is Arabidopsis thaliana L-galactose dehydrogenase (L-galbH) protein. The L-galbH gene is located on

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABI16176-ABI30511), expressed DNA sequences (ABI16176-ABI30511), expressed DNA BST2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 Genomic DNA from Arthrobacter oxidans F1 was subjected to restriction enzyme analysis and the N-terminal amino acid sequence of L-fucose dehydrogenase determined. A degenerate probe was synthesised based on this amino acid sequence. The probe was used to screen an Arthrobacter CDNA library to isolate a L-fucose dehydro- genase clone. The isolation of such a clone provides a convenient method for prodn. Of L-fucose dehydrogenase without the need for induction by L-fucose. The probe may be used to evaluate the extent of expression of L-fucose dehydrogenase. The DNA sequence is widely used to assay L-fucose levels. The protein sequence of L-fucose dehydrogenase asquence of L-fucose dehydrogenase may be used to produce antibodies. (Updated on 25-WAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

The invention relates to a recombinant DNA construct comprising a provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant comprised property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the copy, uncleotide or polypeptide is useful for improving plant with the improved plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or perses, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of grobohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plants of modification of photosynthesis or by providing improved plants growth and development under at least one stress condition, improved plants of my improved galactemann condition, improved plant growth and development under at least one stress condition, improved plants of my improved galacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form at norm and an entired and an orm of photosynthesis or by an orm of the norm at norm at norm at norm at norm at norm at norm at nor
 New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; heat tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
conclude acid; (2) a host cell containing the vector; (3) an isolated
controlled acid; (2) a host cell containing the vector; (3) an isolated
colypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
coliferation or the activity of a gene in an operon required for
proliferation or the activity of a gene in an operon required for
controlled for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation or the biological
controlled for proliferation-required gene or its gene product lies
correctly; (1) anniferation-required gene or its gene product lies
correctly; (1) manufacturing an antibiotic; (10) profiling a
corporate activity; (11) a culture comprising strains in which the gene
compound sactivity; (11) a culture comprising strains in which the gene
compound sectivity; (11) a culture comprising strains in which the
compounds of the strains is present in a culture or collection of
compounds; or (13) identifying the target of a compound that inhibits the
controlleration of an organism. The antisense nucleic acids are useful for
dentifying proceins or screening for homologous nucleic acids required
controlleration of an organism. The suddicter molecules for rational
 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymodeotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant such as maize or soybean. The method of producing a transformed plant to such as maize or soybean. The method of producing a transformed plant with the cacombinant DNA construct and growing the transformed plant where the polymucleotide or polypeptide is useful for improving plant with the combinant DNA construct is useful for improving plants with improved plant properties, extreme osmotic conditions, pathogens or polymucleotides, extreme osmotic conditions, pathogens or persons increased rate of increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified sease, better growth rate by modification of the photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lighial production of improved algain production of improved algain production of photosynthesis or by production, improved lighial production or improved galactonannan condition, improved lighial production or improved galactonannan condition, improved plant growth and development under at least one stress condition, improved lighial production or improved galactonannan condition, may to the printed specification of improved dignial production or improved galactonannan condition, may may be a pacterial polypeptide used in the scope of the invention. Note: The sequence atta for this patent did not form part of the printed specification but was obtained in electronic condition.
 New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
Recombinant DNA construct; transformed plant; improved plant property; cold tolorance; heat tolerance; drought tolerance; heat tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomanna; bacterial polypeptide.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a crop plant cauch as maize or soybean. The method of producing a transformed plant to such as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a plant with the carcombinant DNA construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plant properties. Cr The recombinant DNA construct is useful for improving plants with construct is useful for improving plants with crecased plant properties, e.g. improved cold, heat or accomplation. Cr The recombinant DNA construct is useful for improving plants with increased resistance to plant disease, better growth rate by modification cr for expendence of the cell cycle pathway with plant growth rate by modification of carbohydrate, introgen or phosphorus use and/or uptake, by modification of forbotosynthesis or by providing improved plant growth and development under at least one stress condition, improved lightin production or improved algain production or improved galactomannan crop production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence date for this patent did not form part of the printed specification but was obtained in electronic correct form part of the printed specification but was obtained in electronic correct or scope of the printed specification but was obtained in electronic correct or scope of the printed specification but was obtained in electronic correction.
 provide
 New recombinant DNA construct comprising a promoter positioned to provi for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a barcherial infection, for evaluating a compound, such as a polypeptide, cor the ability to bind a P. aeruginosa mucleic acid, as components of effective antibacterial targets, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences AB067826-
Desudomonas species using biochip technology. Sequences AB067826-
Sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html
 Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.

ALIGNMENTS

ACA20791 AAF61103

The present invention relates to an isolated protein having L-galactose dehydrogenase (L-galDH) biological activity. L-galDH nucleic acid is L-galactose dehydrogenase; L-galDH; transgenic organism; ascorbic acid; Novel L-galactose dehydrogenase protein and nucleic acid sequence encoding the protein for producing genetically modified plants and microorganisms with enhanced ability to synthesize ascorbic acid. /\*tag= a /product= "L-galactose dehydrogenase (L-galDH)" Arabidopsis thaliana L-galactose dehydrogenase (L-galDH) cDNA Location/Qualifiers 11..960 /\*tag= a Claim 6; Page 56-57; 58pp; English. ```
useful for generating transgenic organisms and modified pants with enhanced ability to synthesise ascorbic acid. L-galDH facilitate the production of a plant that has been genetically modified to express a mutated L-galDH protein which is resistant to herbicides that act against the naturally occurring L-galDH and to identify and/or design compounds that are inhibitors of L-galDH. The compounds can be used, for e.g. in a herbicide which acts on L-galDH and damages or kills plants that express the enzyme. The present sequence is Arabidopsis thaliana L-galactose dehydrogenase (L-galDH) cDNA. The L-galDH gene is located on chromosome 4

The invention relates to generating ascorbic acid or its salt, involves obtaining a recombinant yeast capable of converting an ascorbic acid precursor into ascorbic acid culturing the recombinant yeast in a medium comprising an ascorbic acid precursor, thus forming ascorbic acid, and conjusting the ascorbic acid and conjusting the ascorbic acid, and conjusting the ascorbic acid. Also include are stabilising ascorbic acid or its salt in a medium, by culturing a yeast in a medium comprising a scorbic acid or its salt and a recombinant yeast functionally conjustively selected from L-galactose dehydrogenase (LODH), L-galacton-1, 4 lactone oxidase (ADD), D-arabinose dehydrogenase (ADD), D-arabinose dehydrogenase (ADD) acid acid at least about 25% ascorbic acid precursor of converting to ascorbic acid at least about 25% ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor or the yeast is cultured in a medium comprising one ascorbic acid precursor. The ascorbic acid produced (Vitamin C) is a powerful antioxidant, a deficiency of which causes scurvy in humans. The present sequence encodes

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACNA5220-ACN63099). The ESTB were isolated from CDNA libraries generated
from primed or non-primed seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
tissue, developing fibres, carpel walls and septe from variety
CC tissue, developing fibres, carpel walls and septe from variety
CC fivention, and to transformed seeds by nucleic acid molecules of the
invention, and to transformed plants having a nucleic acid construct
CC molecular tags to isolate genetic regions, to isolate genes to molecule acid construct
CC comprising a nucleic acid of the invention. The cotton ESTB are useful
CC for isolating a variety of agronomically significant genes
CC used for isolate gene family. The nucleic acid molecules may be
CC used for isolate genes family. The nucleic acid molecules are
CC used for isolate genes inportant in initiating and
CC also useful for identifying genes important in initiating and
CC also useful for identifying genes important in initiating and
CC also useful for identifying genes important in initiating and
CC also useful for identifying genes important in initiating and
CC also useful for identifying genes important in initiating and
CC also useful for identifying genes important in initiating and
CC also useful for identifying genes important in initiating and
CC also permination or that may be used to miligate stresses encountered
CC during seed germination. The ESTS additionally enable the acquisition of
CC promoters and cis-regulatory elements which will be useful for estenses
CC and also permits the acquisition of molecular markers useful for
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the expression level or pattern of a protein or wardety DPSOB primed seed condition the primed seed condition to the printed seed condition to conton variety DPSOB primed seed New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular segdata.uspto.gov/sequence.html?DocID=US20040123340 Ziegler TE; Claim 1; SEQ ID NO 3555; 34pp; English. The invention relates to 17880 cotton expressed sequence tags (ESTs; ACM45220-ACM50399). The ESTs were isolated from CDM libraries generated from primed or non-primed seeds frow variety DB50B, mature seeds from variety COker 312 Boswell 96 Field, and androectum tissue, gynoecium tissue, developing fibres, carpel walls and septe from variety Nucotton33B. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes, to map

members of a particular gene family. The nucleic acid molecules may be members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The BSTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express any significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically schemes, genetic and molecular mapping, and in cloning of agronomically catentificant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed BST isolated from a cotton variety DPSOB primed seed cDNA library (LIBBSES). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175, and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

WPI; 2004-479808/45.

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 816; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACN45220-ACN63099). The ESTB were isolated from CDNA libraries generated
from primed or non-primed seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
tissue, developing fibres, carpel walls and septa from variety
C whoctton33B. The invention also relates to substantially purified
c proteins or their fragments encoded by nucleic acid molecules of the
invention, and to transformed plants having a nucleic acid construct
C comprising a nucleic acid of the invention. The cotton ESTB are useful as
molecular tags to isolate genetic regions, to isolate genes, to map
C genes, to determine gene function and to determining whether genes are
C members of a particular gene family. The nucleic acid molecules may be
C gened for isolating a variety of agronomically significant genes
C used for isolating a variety of agronomically significant genes
C associated with plant growth, quality, yield, and could also serve as
Iinks in metabolic and catabolic pathways. The nucleic acid molecules are
C also useful for identifying genes important in initiating and maintaining
C seed germination or that may be used to mitigate stresses encountered
C during seed germination. The ESTS additionally enable the acquisition of
C promoters and cis-regulatory elements which will be useful to express
C and also permits the acquisition of molecular markers useful in breeding
C schemes, genetic and molecular markers useful in breeding
C schemes, genetic and molecular markers useful in breeding
C schemes, genetic and molecular markers useful for
C detecting the expression level or pattern of a protein or mRNA and for
C detecting the expression level or pattern of a protein or mRNA and for
C detecting the presence or quantity of a protein by tisquence
C detecting the sequence represents a specifically claimed EST isolated from a
C cotton variety DPSOB primed seed CDNA library (LIBB3825). The sequence

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

the following relates to an isolated nucleic acid compirating any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense contisense mucleic acid; (2) a host cell containing the vector; (3) an isolated by the nucleic acid; (4) an antibody capable of specifically binding the polypeptide of the polypeptide of the activity of a gene in an operon required for the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway or the proliferation or that inhibits proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids are useful for confileration of an organism. The antisense nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. prokaryotic essential genes. Note: scenening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, continue form part of the printed specification, but was obtained in celectronic format directly from WIPO at requence decreased to the printed specification, but was obtained in celectronic forms part of the printed specification.
 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

 Description
 Sequence
Sequence
Sequence
Sequence
Sequence
 Sequence
 Pred. No. is the number of results predicted by chance to h
score greater than or equal to the score of the result bein
and is derived by analysis of the total score distribution.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Gatzek, S., Wheeler, G.L. and Smirnoff, N.
Antisense suppression of 1-galactose dehydrogenase in Arabidopsis
thaliana provides evidence for its role in ascorbate synthesis and
reveals light modulated 1-galactose synthesis
Plant J. 30 (5), $41-553 (2002)

 AIVJUSS7 960 bp mRNA linear PLN 24-MAR-2002
Arabidopsis thaliana AT4g33670/T16L1_160 mRNA, complete cds.
AY090337
 The Salk, Stanford, PGEC (SSP) Consortium members carried out the sequencing and annotation of the RAFL CDNAs: Cheuk, R., Chen, H., Kin, C.J., Meyers, M.C., Shinn, P., Banh, J. Bowser, L., Chan, M.M., Chang, B., Dale, J.H., Deng, J.M., Goldsmith, A.D., Jones, T., Karlin-Neumann, G., Lam, B., Lee, J.M., Lin, J., Miranda, M., Nguyen, M., Onderac, C.S., Paln, C.J., Quach, H.L., Southwick, A., Tang, C.C., Theologis, A., and Ecker, J.R.
 Submitted (14 MAR-2002) Salk Institute Genomic Analysis Laboratory (SIGNAL), Plant Biology Laboratory, The Salk Institute for Biological Studies, 10010 N. Torrey Pines Road, La Jolla, CA 92037,
 Cheuk, R. (SSP/Salk) and Seki, M. (RIKEN GSC) contributed equally to this work. Shinozaki, K. (RIKEN GSC) and Ecker, J.R. (SSP/Salk) contributed equal to this work as PIs. Location/Qualifiers
 Cheuk, R., Chen, H., Kim, C.J., Meyers, M.C., Shinn, P., Banh, J., Cheuk, R., Chen, H., Kim, C.J., Meyers, M.C., Shinn, P., Banh, J., Bowser, L., Carninci, P., Chang, B., Dale, J.M., Goldsmith, A.D., Hayashizaki, Y., Ibilda, J., Jones, T., Kamiya, A., Karlin-Neumann, G., Kawai, J., Lam, B., Lee, J.M., Lin, J., Miranda, M., Narusaka, M., Nguyen, M., Onodera, C.S., Palm, C.J., Quach, H.L., Sakurai, T., Saton, M., Southwick, A., Tang, C.C., Toriumi, M., Wu, H.C., Yamada, K., Yamamura, Y., Yu, G., Yu, S., Shinozaki, K., Davis, R.W., Theologis, A. and Ecker, J.R.
 RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL cDNAs (RAFL cDNA; RIKEN Arabidopsis Full-Length cDNA); Seki,M., Narusaka,M., Ishida,J., Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J., Hayashizaki,Y. and Shinozaki,K.
